

# Multiple IP Address polling support for a single node

---

It is taken from a feature request from [Questionario](#) . By the way we need this badly.

[Re: Feature Request: Multiple IPs per Node](#)

Hi, right now I have several nodes double and triple for monitoring purposes.

One would be the standard Management VLAN IP, another for OSPF and another for a backup tunnel (which is constantly up)

now the management IP is reachable as long as one of these still work but I want to be notified if either of them goes down as well.

I dont need to get performance reports about each single IP but still get notifications if the IP on the node is unreachable!

So it would be a nice enhancement to simply add more "secondary" IPs to nodes without having to create another object (Its not about the licenses but about the manageability).
