Set individual volume thresholds for easier diskspace monitoring

It would be great if we could set critical thresholds on an individual volume basis like is possible with component or application monitors. Creating one size fits all advanced alerts is quite tedious, if not impossible. You could still have the overall disk thresholds, but then when I click on volumes, I'd like to 'override' the default.

This way it could be possible to have a single disk alert, but be applicable to many different volume types and capacities. Fire alert when disk space = critical

Thanks,
Matt
