

True Parent/Children Relationship and easier UI to manage

Make it easier to create and manage Parent/Child relationships. Use an easier UI such as a file directory hierarchy along with drag & drop, to display and manage the relationships. Setup "one-click" rules to manage alerts for children of a parent. If Parent x goes down, one check in a box will silence all alerts on the children. The groups function right now is OK, but it doesn't allow for true relationships, multiple levels down.
