

Bulk Policy Report import/export

The DISA STIG compliance reports are created using separate reports with each report containing policies and rule sets. All of this is stored in the actual database (in 6+ tables) and is not stored locally in the SolarWinds server. To do a bulk import, a SQL query would need to be developed to place all of these reports, rules and policies in the appropriate locations. This would have to be modified every time a new STIG is added (for others to use). This would be very time consuming.

I would like to do a feature request for bulk report import and export. I would like the ability to select multiple reports at one time and export them to a file. When this file is imported, it should import the separate reports (and rules and policies) into the correct locations. This would be very valuable. Please vote this up!
