

display the cause of a alert when node is member of a group.

Hello,

When we use `#{GroupStatusRootCause}` in the message of a alert it wil give the name of the child.

We have a group for alerting '24x7'. In this group there are nodes and groups.

We combined several nodes in groups: Dns, Firewall, Office....

In this case the variable, `#{GroupStatusRootCause}`, will show the name of the group in the alert.

It is usefull to get the cause of the alert in that group. `GroupStatusChildCause` ??

Willem
